

alphasystem

The intelligent health check for rolling stock!

alphasystem is a revolutionary predictive diagnostic system for railway applications. It includes the diagnosis of all kinds of combustion engines, traction motors and bearings. It helps to strike and maintain a perfect balance between operating and maintenance costs.

- alphaengine to diagnose 2-stroke, 4 stroke engines and turbochargers
- alphamotor to diagnose traction motors
- alphabearing to diagnose bearings,
 e.g. axle bearings on bogies

Example of an engine diagnostic report

alphaturbo

With a turbocharger blade passing speed sensor, the turbo's efficiency and mechanical health can be determined by two indicators. Compression informs about speed variations due to bearing friction giving a feedback about efficiency of turbine, compressor and rotor shaft. Stress indicates presence of mechanical shock pulses during operation indicating a mechanical damage of turbine, compressor or rotor shaft.

Product Features

- Inline and V-type
- 2 or 4 stroke engines
- Up to 30 cylinders
- Diesel, natural gas, gasoline, or heavy furnace oil engines

Information about Engine Condition

Non-cylinder specific indicators

Mechanical Health is the overall indication of the mechanical condition of the engine.

- **Operating Condition** indicates how efficiently the engine is running.
- Mechanical Stresses informs about the presence of unexpected stress -1.1°1.1pulses in the crankshaft twist.

Mounts indicates engine imbalance due to non-optimal thermal health

- and inertial resistance of moving parts.
- **Torsional** Angle informs about ∇ dynamic torsion in the crankshaft.

Cylinder specific indicators

Compression compares cylinder pressures and indicates power loss or efficiency of the engine.

- **Injection** gives an information about injection timing and fuel atomization.
 - Bearing indicates dynamic behavior of bearings and all moving parts.

Example of a turbocharger diagnostic report

- Independent of engine manufacturer
- One speed sensor gives information about overall operating condition
- Second speed sensor enables cylinder specific diagnosis
- Third speed sensor enables turbocharger diagnosis

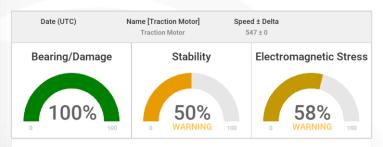

Example of a bearing diagnostic report

🔯 alphamotor

alphamotor is designed to determine the health condition of several motor parts (rotor, static and dynamic eccentricities, bearings) of electric and traction motors by analyzing torsional vibration of the shaft. The system has a built-in automatic expert system which provides the possibility of remote motor monitoring. It is of non-invasive nature and offers broad fault coverage. alphamotor is suitable for almost all electric and traction motors and is easy to install or retrofit.

alphabearing

Excessive wear of axle bearings can result in reduced bearing lifetime, increased operating costs, and unscheduled maintenance of locomotives, railroad cars, and coaches. By using **alphabearing** for bearing health condition monitoring, a fault can be detected at its initial stage. This allows sufficient time for repairs before significant failures occur, supporting operators to improve scheduling of their maintenance.

Example of a motor report

Product Features

- Use of non-intrusive sensors
- Early warning in case of risk of damage
- Optimization of spare part logistics
- Easy installation
- Reduction of maintenance overtime work
- High repeatability and accuracy
- Fully automatic operation
- Reliable and compact measuring device
- Maintenance free

🔗 alphacloud

alphasystem collects diagnostic reports of measured devices and sends them from anywhere to **alphacloud** or any customer's cloud via GSM or other connected communication channel. This offers an unprecedented advantage and boosts your cost savings. **alphacloud** makes it possible for the condition monitoring and predictive maintenance to take place at any time and from any location via web-based access and coordination and helps to

- Reduce site visits with remote equipment monitoring and control.
- Ensure continuous operation of equipment, no matter how remote.
- Receive alerts, alarms and quickly identify problems as they occur.
- Improve operations, reduce costs and increase production/profits.
